

Vaccination Decision Making Tool

Project Summary

Problem

Vaccination services are not optimally used by many communities, despite humanitarian efforts in providing information and access to vaccines. Vaccination decision making is a complex situation which requires deep understanding of local dynamics and community characteristics

Proposed Solution

Assess vaccination decision making processes and identify barriers and enablers to design community-based strategies specifically adapted to the intervention by developing and testing an innovative, user-friendly and community-centered tool.

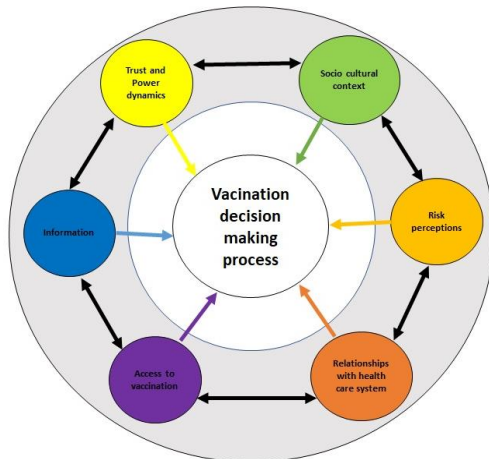

Figure: Conceptual framework scheme

Potential Impact

- Adapts vaccination programs to community specific contexts to increase adoption
- Defines barriers to vaccination
- Promotes Field Health Promotion Team capacity

Viability

- Capitalizes on existing exploration work and tool development
- Brings together a strong team of experienced researchers, anthropologists and epidemiologists

Risk Mitigation

- Pilots the tool in multiple contexts to address potential field constraints and requirements
- Includes strong involvement of users

Scalability

- Disseminates digital tool and training material across MSF and to external groups

Area/Type: OIT; Incubator

Sponsor/Support: OCB

Length/Project Status: 12 months; **ONGOING**
